

Where the pressure departs from isotropy

Fresh WarpX particle-count control · 576² cells · 32 particles per cell per species · 4 × 4 measurement bins

What the colors mean

0 = isotropic pressure tensor

0.20 = hypothesis threshold

Each tile averages the local tensor departure over $t\Omega_{ci} = 0.3\text{--}0.8$.

All three velocity components enter.

The two means are below 0.20.
Controls and uncertainty still matter:
a low value alone is not a verdict.

Outcome: unresolved.

The planned fresh-seed evidence run was deferred for lack of time.
